Lab 4: Simple Linear Regression

Please do not hesitate to ask me any questions throughout this lab.

Exercises: Linear Regression in Python

- Search the web for a dataset with one dependent and one independent variable with a
- linear nature in a field of your interest (Finance, gaming, healthcare, IoT, robotics, retail, etc..). (You can search Kaggle.com using phrases like “Linear regression”)
- Download the dataset to your PC.
- In your notebook, create a markdown cell “Importing the dataset.”
- Create a code cell that will import the dataset to a Pandas DataFrame, as it was shown in the class demo.
- Visualize the dataset and confirm that there is a linear relationship between the variables.
- Split the data set to training and testing data (70:30 ratio).
- Visualize the points in both sets.
- Fit a linear regression model and evaluate it on the testing dataset.

Enjoy!
